## RESEARCH REPORT

No. 171

## Social Accounting Matrix of Pakistan for 1989-90

Rizwana Siddiqui<br>Zafar Iqbal

The PIDE Research Report Series offers an up-to-date exposition of various economic, demographic, and anthropological aspects of the development process in developing countries generally and in Pakistan particularly. Its wide dissemination is aimed at providing a firm foundation for useful policy-making in addition to encouraging academic interaction.

The major areas of research addressed by the Series are macroeconomics and sectoral issues, international trade, labour market issues, demographic patterns, anthropological approaches, growth, and distribution. Manuscripts submitted for publication in the Series are reviewed by the PIDE Research Report Committee and published from time to time.

## 1. INTRODUCTION

Since last three decades, the social accounting matrix (SAM) has been extensively used as a tool for policy analysis. ${ }^{1}$ Recently, the SAM framework is commonly used in computable general equilibrium (CGE) models for analysing structural adjustment reforms and their impact on income distribution and poverty in developing countries (for example, Robinson (1988) and Taylor (1990) provide a comprehensive survey on SAM-based CGE modelling). The classification and disaggregation of accounts in a social accounting matrix can take various forms, depending on how the constituent accounts are defined and depending on one's analytical interests and specific policy concerns. There are two main objectives of the report. First, it develops a latest social accounting matrix for the year 1989-90 with possible disaggregation of the households sector based on income levels. It is worth to note that earlier social accounting matrix for the, year 1984-85 developed by the Federal Bureau of Statistics did not provide a disaggregation of the households sector. This limits the analysis of the households sector, particularly when distributional and redistributional aspects need to be given importance. Therefore, this paper fills this gap. The SAM developed here will later assist in operationalising the CGE model to be developed for Pakistan in order to analyse the Micro Impact of Macroeconomic Adjustment Policies (MIMAP) on income distribution and poverty in Pakistan under MIMAPPakistan Project. Second, this report intends to calculate the impact multipliers of socio-economic linkages using the static fixed-price SAM-based framework.

The compilation of a comprehensive input-output (I-O) table started in Pakistan in 1975-76 by the Pakistan Institute of Development Economics (PIDE) and the first detailed 1-O table was produced in 1983 and the first social accounting matrix for the year 1979 was published in 1985 by the Pakistan Institute of Development Economics. While the Federal Bureau of Statistics (FBS) started compilation of the social accounting matrix for 1984-85 and the second consolidated SAM for the year 1984-85 was produced by the FBS in 1993 with the collaboration of the Dutch Government under Improvement of National Accounting System (INAS) project. The macroeconomic variables in the accounting matrix for 1984-85 were derived from the estimates of the Institutional Sector Accounts for 1984-85 and from the 1-O table 1984-85 for

[^1]Pakistan. The FBS continued its endeavours and produced the second 1-O table for the year 1989-90 in 1996. The information presented in 1-O table 1989-90 includes supply and use tables and the industry by industry flow table. The 1-O table provides an elaboration of the production account of the system of national accounts in Pakistan for the year 1989-90. The Integrated Economic Accounts (IEA) for the same year 1989-90 have also been compiled in conjunction with the 1-O table for 1989-90: The IEA was developed using different data sources, for example. National Accounts Statistics; Balance of Payment Statistics; Household Income and Expenditure Survey; and Public Finance Statistics. The Integrated Economic Accounts provide a comprehensive overview of interrelationships between economic agents involved in income generation, distribution, accumulation and finance in the economy. The full details of the methodology and data sources used in the preparation are described in the main documents of 1-O table and IEA for 1989-90. ${ }^{3}$

Since the FBS did not produce the social accounting matrix for the year 1989-90, using input-output table and integrated economic accounts for the year 1989-90, we attempt to compile a latest social accounting matrix for the same year 1989-90 with disaggregation of the households sector. In the present SAM, the input-output industry classifications have been condensed into five main production accounts namely agriculture, industry, health, education and other sectors. The SAM 1989-90 also includes two factors of production (labour and capital), four economic institutions (households, firms, government, and rest of the world) and one aggregate capital accumulation account. The households account is further disaggregated by four income categories of rural and urban households in Pakistan, These accounts relate to the circular flow of production, consumption, and accumulation. It also provides details about the key macroeconomic variables and institutional relationships of Pakistan's economy for the year 1989-90 in the framework of the integrated system of national accounts. In this format, it yields a $28 \times 28$ social accounting matrix of Pakistan. ${ }^{4}$

The report is divided into six sections. Following the introduction, section II describes the schematic presentation of a SAM. Section III shows the compilation of aggregate SAM of Pakistan for the year 1989-90 and describes the production, income, expenditure, and accumulation accounts. Disaggregation

[^2]of the households sector is described in section IV. The multipliers are calculated and explained in Section V. The final section gives concluding remarks and also indicates the extension of work for the modelling component of MIMAP - Pakistan.

## 2. THE STRUCTURE OF A SOCIAL ACCOUNTING MATRIX

A Social Accounting Matrix (SAM) for the year 1989-90 in Table 1 presents a summarized but comprehensive picture of the whole economy by showing the interrelationship among different aspects of economic transactions in production, consumption, and investment. According to standard accounting principles of a SAM, incoming (income) in one account is balanced by an outgoing (expenditure) of another account. Since incoming and outgoing are recorded in a single entry system, the social accounting matrix is a square matrix by definition. For every row there is a corresponding column and sum along the row is equal to the sum along the corresponding column. A theoretical structure of a social accounting matrix (with the aggregate households sector) for the year 1989-90 is reported in Table 1. It is $21 \times$ 21 matrix which includes 20 rows and columns for real sectors and one row and its respective column for aggregate capital account. This SAM presents four types of accounts: factors account, institutions account, production account, and capital account. These accounts are disaggregated on the basis of requirements and availability of data. Factors of production account is disaggregated into labour (L) and capital (K) accounts. Institutions accounts consist of aggregate households (HH), firms (F), government (G), and rest of the world (R). These accounts elaborate the inter-institutional linkages. Production account is disaggregated into agriculture (A), industry (I), education (E), health (H) and other sectors (O). Further disaggregation of production account of ith goods is also made on the basis of goods for domestic market and for export market. Finally, it presents consolidated capital account. A brief discussion on each account reported in Table 1 is given in the following sub sections.

### 2.1. Factors Account

This account is related to two factors of production namely labour and capital. It distinguishes between the wages to labour and capital income (operating surplus) engaged in the production activities in i sectors of the economy. Ten cells at the cross of first two rows and 7 to 11 columns indicated in Table 1 together constitute value added module. Where WA, W," WE, WH, and $\mathrm{W}_{\mathrm{O}}$ in these cells present wages to labour from agriculture, industry, education, health, and other sectors, respectively. Similarly, RKA, RK, RKE, RKh, and $\mathrm{RK}_{0}$ present, respectively, capital income from agriculture, industry, education, health, and others sectors. This income is distributed among 1 agents. All wage income $(\mathrm{W})$ is received by households as remuneration for their

## Table 2

## Notation and Definition

| Notation | Definition |
| :---: | :---: |
| $\mathrm{i}=(\mathrm{A}, \mathrm{I}, \mathrm{E}, \mathrm{H} . \mathrm{O})$ | Branches of production (A=agriculture, I=industry, E=education, H=health, $\mathrm{O}=$ other sectors) |
| $1=($ HH.F,G,R, $)$ n | Agents (HH=households, $\mathrm{F}=$ firms, $\mathrm{G}=$ govemment, and $\mathrm{R}=$ rest of the world) Households income groups (1,2,3,4) |
| CAB | Current account balance (foreign savings) |
| DIV,,", | Dividends paid to households |
| Dmij | Households consumption of good i |
| DG, | Government consumption of good I |
| D, | Depreciation |
| ET, | Exports of good i |
| HR | Rural households |
| HU | Urban households |
| HU 1/HR 1. HU 2/HR2, HU3/HR3, HU4/HR4 | Households groups (HU $1 /$ HR $1=$ urban/rural households having income level upto Rs.2500. HU2/HR2= urban/rural households having income level Rs.2501-4000, HU3/HR3= urban/rural households having income level Rs.4001-7000, and HU4/HR4= urban/rural households having income level Rs.7001\&above. |
| 1 Dl | Income tax paid by agent I |
| II, | Indirect taxes on good i |
| $\mathrm{IC}_{\text {ii }}$ | Intermediate consumption produced by branch I and consumed by branch j |
| IT | Total gross investment |
| IV, | Consumption of good i for investment uses |
| M, | Imports of good i |
| RK, | Capital income from i branches of production |
| RK1 | Capital income of agent I |
| RK | Total Capital Income |
| RR | Total payments to or receipts from the rest of the world |
| S, | Agent l's savings |
| SUB, | Subsidies on production i |
| ST | Total gross savings |
| Toim | Government transfers to households |
| f, \% | Government transfers payments to firms |
| TRHH | Foreign transfers to households (in local currency) |
| TR | Foreign transfers to government (in local currency) |
| $\mathrm{T}_{\text {*R }}$ | Firms transfers to the rest of the world |
| TM, | Import duties on good i |
| VD, | Local production of good I sold in domestic market |
| VX, ${ }^{\text {s }}$ | Total supply of good I |
| VX ${ }^{\prime \prime}$ | Total demand of good I |
| W, | Wages paid by branch I |
| W | Total wage payments |

services of supplied labour. On the other hand, capital income is distributed among all agents namely households (RKHH), firms (RKF), and the government (RKo). Algebraically, equations for labour income and capital income can be written down. Left side of each equation represents income of an account and right side shows expenditure of that account.

Labour Account

$$
W A+W,+W E+W H+W_{O}=\boldsymbol{W} \quad \ldots \quad \ldots \quad \ldots \quad \text {... (1) }
$$

Capital Account

\end{array}
$$

$$
\begin{equation*}
W+R K=G D P F C \tag{3}
\end{equation*}
$$

Gross domestic product at market price_(GDPmd

$$
\begin{equation*}
W+R K+27 /,+I T M i+2 D_{i}=G D P M P \tag{4}
\end{equation*}
$$

### 2.2. Agents Account

This account comprises aggregate households, firms, government, and rest of the world. Rows 3-6 present income of these agents and 3-6 columns present expenditure of the respective accounts in Table 1. Accounts of these agents are described in the following paragraphs.

### 2.2.1. Aggregate Households Account

The households receipts ( $\mathrm{Y}_{\boldsymbol{\wedge}}$ ) are presented in the third row of the SAM 1989-90, which include labour income (W) and capital income (RKHH) from five production activities (agriculture, industry, education, health, and other sectors). In addition to these incomes, households also receive income from other institutions such as dividends from firms (DIV,,\%), transfers from the government (TGHH), and transfers from the rest of world (TRHH). In accounting principle, income df households must be equal to households expenditure. Therefore, direct taxes paid to the government (IDHH), households consumption of goods of agriculture, industry, education, health and other sectors (DHHA, DHH, DHHE, DHн , DHHO ), comprise households total expenditure where SHH is saving of households. The mathematical expression for income and expenditure of the households can be written as follows:

Income: $\boldsymbol{W}+$ RKHH $+D I V+T G H H+T m H=Y H H$

Expenditure: $I D m+E D H H i+S H H=Y H H$

### 2.2.2. Firms Account

Firms' income (YF) includes capital income (RKF) and transfers from the government (TGF). This income has to be balanced with firms' payment to households in terms of dividends (DIVHH), direct taxes paid to the government (IDf), transfers to the rest of the world (TFR) and their saving (SF). Income and expenditure of firms can be mathematically written as:
$\begin{array}{lcclll}\text { Income: } R K F+T C F=Y F & \ldots & \ldots & \ldots & \ldots & - \\ \text { Expenditure: } & D I V m+I D F+T F R+S F=Y F & \ldots & \ldots & \ldots & \ldots\end{array}$

### 2.2.3. The Government Account

This account describes the balance between government receipts and expenditure. Government receipts $\left(\mathrm{Y}_{\mathrm{O}}\right)$ include capital income from production process ( $\mathrm{RK}_{\wedge}$ ), direct taxes paid by households (ID ${ }_{\wedge}$ ) and by firms (IDF), transfers from the rest of the world (TRG), indirect taxes from agriculture, industry, education, health and other sectors ( $£ 11$, ), and import duties from agriculture, industry, education, health and other imports (ZTM). Corresponding column shows the composition of government expenditure in the form of transfers to households (TGHH), transfers to firms (TGF), production subsidies to agriculture, industry, education, health and other sectors (ESUB,), final consumption of agriculture, industry, education, health and other sectors (EDG,) and its saving/deficit (SG). Equations for this account are as follows:

Income: $R K C+I D H H+I D F+T R G+27 /,+2 T A /,=Y c \quad \ldots \quad . . \quad$ (9)
Expenditure: $T G H H+T_{O F}+I S U B j+H D G_{j}+S G .=Y a$

### 2.2.4. Rest of the World Account

This institution account shows demand for our exports to and supply of imports from the rest of the world. Along the 6th row of Table 1 are transfers by firms ( Tfr ) to the rest of the world and demand for imports of agriculture, industry, education, health and others (EM), which together constitutes income of the rest of world. Along the corresponding column are expenditure of rest of the world which includes net transfers to households (TRHH), transfers to the government (TRG) from the rest of the world and demand for our exports for agriculture, industry, education, health and other sector (SET). Income and expenditure of die rest of the world are balanced by adding foreign savings (CAB) along the column in the capital accounts, that is current account balance of the balance of payments. The equations for this account are as follows:

Income: $T$ FR $+E M t=R R$
Expenditure: TRHH + TRG $+E E T i+C A B=R$,

## 23. Production Account

The classification of the production account includes agriculture, industry, education, health and other sectors. (These accounts are condensed by aggregation of 86 sub-sectors in Input-Output Table for 1989-90 prepared by the FBS (1996). Agriculture sector includes major and minor crops plus fisheries. Industry, includes large scale manufacturing, small scale manufacturing and mining and quarrying. Besides education and health, rest is included in other sectors.) The rows 7 to 11 show the revenue received which includes production subsidies (ZSUBj), sale of goods of agriculture (VDA), industry (VD,), education (VDE), health ( VDH ), and other sectors $\left(\mathrm{VD}_{\mathbf{0}}\right)$ to domestic market and to export market (ETa, ET, ETe, ETh, ETg), which are balanced by the cost of production of these commodities mentioned in the corresponding columns 7 to 11 by value added paid to the factors of production ( $\mathrm{W}+\mathrm{RK}$ ), indirect taxes paid to the government ( Zllj ), intermediate sectoral inputs transfers (ZICy), and consumption of fixed capital (depreciation) in these sectors (ZDj). We can write down these identities as follows:

Supply: $E S U B t+E V D_{i}+E E T i=E V X f \quad . . \quad . . \quad . . \quad$ - (13)
Demand: $E W i+E R K_{;}+E I l_{;}+27 C_{9}+E D_{;}=E V X f$
The production account is further disaggregated on the basis of goods demanded on domestic market and goods for export market. These two accounts are discussed in the following sub-sections.

### 23.1. Goods for Domestic Market

Along the rows 12 to 16, this account shows domestic supply of ith goods while along the corresponding columns is total demand of ith goods. The rows include households consumption of ith good (ZDHHi), government consumption of ith goods (ZDGj) intermediate demand by agriculture, industry, education, health and other sectors (ZICy) and consumption of goods i for investment uses (ZIVj). This should be equal to aggregate demand for domestic output ( $\mathrm{ZVD} ;$ ), imports of goods ( $\mathbf{Z M j}$ ), and imports duties ( $\mathbf{Z T M}_{\mathbf{j}}$ ). The mathematical expressions are:

Supply: EDHHI $+E D G i+E I C_{0}+E I V i=E V X$ ?
Demand: ETMi $+E M,+E V D_{i}=E V X f$

### 2.3.2. Goods for Export Market

Along the rows 17-20, this account shows supply of our exports of agriculture ( ETA ), industry ( ET ), health ( ETH ) and other exports ( $\mathrm{ET}_{0}$ ) to the rest of the world. ${ }^{5}$ Respective columns shows demand of our exports (ETA, ET,, ETH, $\mathrm{ET}_{0}$ ) by the rest of the world. The equations are as follows:

Supply: ETA $+E T,+E T H+E T_{O}=L E T$,
Demand: $E T A+E T,+E T H+E T_{O}=I E T$,

### 2.4. Consolidated Capital Account

This account is very important as it determines its link with the real sectors of Pakistan's economy. The aggregate capital account shows that total investment (IT) is financed by total gross savings (ST). Gross saving is calculated by adding consumption of fixed capital in producing i goods (Sty) to the sum of households saving (SHH), firms saving (SF), government saving (SG), and foreign saving (CAB). Along the column 21, it shows gross investment in agriculture (IVA), industry (IV,), education (IVE), health (IVH) and other sectors ( $\mathrm{IV}_{\mathrm{O}}$ ). According to principle of national accounts, gross savings must be equal to gross investment. Following equations show mathematical expression for consolidated capital account.

Gross Savings: $S H H+S F+S G+C A B+I D,=S T$
Gross Investment: $I V A+I V,+I V E+I V H+I V_{O}=I T$

## 3. THE AGGREGATE SOCIAL ACCOUNTING MATRIX FOR 1989-90

The aggregate social accounting matrix of Pakistan for the year 1989-90 is presented in Table 3. The Table is, in essence, the matrix presentation of the standard production, income and outlay, and capital and finance accounts combined with the input-output table 1989-90. The present matrix focuses on inter-sectoral linkages. Its presentation allows each transaction in the accounts to be represented by a single cell in the matrix. It is compiled using simple accounting principle; each flow implies an income for the row account and an outlay for the corresponding column account. Table 3 provides a complete picture of the circular flow of Pakistan's economy for the year 1989-90. It recognises factors account, institutions account, production account and aggregate capital account. Further, the production account is distinguished into goods for domestic market and goods for export market. In the following sub-sections, we describe the main accounts of the aggregated SAM reported in Table 3.

[^3]Table 3
Aggregate Social Accounting Matrix of Pakistan, 1989-90

### 3.1. The Income and Expenditure Account

## Estimates of Gross Domestic Product

Table 4 shows the broad contours of production structure of Pakistan's economy. It reports breakdown of estimates of GDP under standard expenditure and income approaches, which are derived from the social accounting matrix for 1989-90 reported in Table 3. The notable feature of SAM 1989-90 is that there are no discrepancies between the three measures of GDP. Table 4 shows that GDP in the year 1989-90 was Rs.843.4 billion, which are close (with marginal difference) to the estimate of GDP given in Pakistan National Accounts (PNA) Rs.855.9 billion in the same year 1989-90. Under the expenditure approach, final household consumption contributes in GDP by 74.5 percent, final government consumption 14.3 percent, total gross fixed capital formation 19.3 percent, aggregate exports of goods and non-factor services 15.2 percent and aggregate imports of goods and non-facto services 23.3 percent in the year 1989-90. Similarly, under income approach, the share of wage payments to labour in

## Table 4

| Total gross fixed capital formation ( $\mathrm{X} / \mathrm{K}$, ) | 163052 | 19.3 |
| Exports of goods and non-factor services ( $S E T$ ) | 128472 | 15.2 |
| Imports of goods and non-factor services ( $E M$ ) | (197207) | (23.3) |
| Gross Domestic Product | 843410 | 100.0 |
| Income Approach of GDP |  |  |
| Wage payments ( $X W$ ) | 209289 | 24.8 |
| Capital income (ERK) | 457397 | 54.2 |
| Gross domestic indirect tax ( $\mathrm{X} 7 /$ ) | 60207 | 7.1 |
| Import duties (ETM ) | 43704 | 5.2 |
| Consumption of fixed capital (ED) |  | (0.9) |
| Production Subsidies (ESUB) |  |  |
|  | 843410 | 100.0 |
| Gross Domestic Product Sectoral Value Added |  |  |
|  |  |  |
| Agriculture ( WA + RKA + IIA + TMA + D , -SUB ) | 215107 | 25.5 |
| Industry ( $W,+R K,+/ /,+T M,+D,-S U B$, ) | 232984 | 27.6 |
| Education ( $W,+R K$ ) + IIE + TM $f_{:}+D_{\text {, }}-$ SUB, $)$ | 17332 | 2.1 |
| Health ( $W, \ldots+R K, \ldots+I_{H}+T M$, + ${ }^{\prime}, \ldots-S U B$, ) | 5967 | 0.7 |
| Other sectors ( $W_{O}+R K a+I I_{O}+T M_{O}+D_{O}-S U B$, $)$ | 372020 | 44.1 |
| Gross Domestic Product | 843410 | 100.0 |

[^4]GDP was 24.8 percent, capital income 54.2 percent, gross indirect tax 7.1 percent, import duties 5.2 percent, and consumption of fixed capital (normally known as depreciation) 9.6 percent in the year 1989-90. Government also provides $1 \%$ of GDP as production subsidies to various sectors of the economy. Regarding the sectoral shares in GDP, Table 4 shows that the agriculture sector contributes 25.5 percent, industry 27.6 percent, education 2.1 percent, health 0.7 percent and other sectors 44.1 percent in the year 1989-90.

### 3.2. Factors of Production Account

Table 5 delineates the sectoral shares in aggregate wage payments to labour and capital income. It reveals that the share of wages from agriculture sector in aggregate wage payments was 21.8 percent, industry 21.7 percent, education 6.6 percent, health 1.4 percent and other sectors 48.5 percent in the year 1989-90. Similarly, the agriculture sector contributes in aggregate capital income by 34.5 percent, industry 18.3 percent, education 0.6 percent, health 0.6 percent and other sectors 46.0 percent.

Table 5

### 3.3. Sources and Uses of Income of Agents

## Sources of Income of Agents

Table 6 shows the sources of income of various institutions during the year 1989-90. These estimates are derived from Table 3 of aggregate social accounting matrix for 1989-90. Starting from households, Table 6 indicates that all wages are allocated to households, which are 30.5 percent of total households income. In addition, households receive 54.1 percent rent of their total income as capital income, which is the predominant share, while the remaining shares of households income are 7.1 percent as dividends from firms, 1.4 percent as transfers from the government, and 6.9 percent of total income as
net factor income from the rest of the world. Firms receive 65.6 percentage share of their total income as capital income and the remaining 34.4 percent are received as transfers from the government. Table 6 also shows that of the total

Table 6
Sources of Incomes of Agents

|  | (Rs. million) | \% share in total income |
| :---: | :---: | :---: |
| Sources of Income |  |  |
| Households |  |  |
| Wages of labour ( If ) | 209289 | 30.5 |
| Capital income ( RKmi ) | 371058 | 5.4.1 |
| Dividends from Firms (DIV) | 48559 | 7.1 |
| I ransfers from government (Tnnu) | 9225 | 1.4 |

| Government |  |  |
| Direct tax from households (IDWI) | 3409 | 2.4 |
| Corporate tax from firms (ID,.) | 24588 | 17.1 |
| Transfers from the rest of the world ( TnrJ | 11544 | 8.0 |
| Gross indirect tax (2.7/,) | 60207 | 42.0 |
| Import duties (274/, I | 43704 | 30.5 |
|  | 143452 | 100 |
| Rest of the World |  |  |
| Interest payments by firms ( 7 ; , /d | 20713 | 9.5 |
| Imports of goods and non-factor services ( $E M$, ) | 197207 | 90.5 |
| Total income ( $R_{\text {, }}$ ) | 217920 | 100 |

income, the government receives 2.4 percent as direct tax from households, 17.1 percent as corporate tax from firms, 8.0 percent as transfers from the rest of the world, 42.0 percent as indirect tax and 30.5 percent as import duties. Finally, the rest of the world receives 9.5 percent of its total income as interest payments from the firms and the remaining 90.5 percent are received from imports of goods and non-factor services by Pakistan in the year 1989-90.

## Uses of Income by Agents

The respective columns of each row in the aggregate social accounting matrix reported in Table 3 give uses of income by the various institution, which are summarised in Table 7. It shows that of the total uses of income, the households spend 0.5 percent as direct tax paid to government, 91.6 percent as final consumption, and the remaining 7.9 percent are households saving. Of the total uses of income, firms pay 36.9 percent as dividends to households, 18.7 percent as corporate tax to the government, 15.7 percent as transfers to the rest of the world and the remaining 28.7 percent are treated as their saving. The government uses its total income as 6.4 percent on transfers to households, 31.6 percent on transfers to firms, 5.8 percent on production subsidies to production

## Table 7

| Total expenditure (RR) |  |  |

sectors, 84.2 percent on final consumption, while the government possesses negative savings (current deficit) of 28.0 percent of its income during the year 1989-90. Table 7 also shows that the rest of the world spends its income as 21.8 percent on net factor transfers to households, 5.3 percent on transfers to the government, 58.9 percent on exports of goods and non-factor services and the balancing 14.0 percent are foreign savings.

### 3.4. Goods for Domestic Market and Export Market

Table 8 shows separate estimates of goods for domestic market and goods for exports market. It shows that a lion's share of agricultural production 98.9 percent is consumed domestically, while the remaining 1.1 percent is exported to the rest of the world. Similarly, of the total industrial production, 84.8 percent is used for domestic consumption and 15.2 percent is exported. Regarding the production of other sectors of the economy, 96.5 percent is consumed domestically and 3.5 percent is exported to the external market. Table 8 also shows that agriculture contributes in total exports by 3 percent, industry 79.6 percent and other exports 17.4 percent.

Table 8
Goods for Domestic Market and Export Market for the Year 1989-90

| Sectors | $\begin{gathered} \text { Tout } \\ \text { production } \\ \left(\mathrm{VX},{ }^{\mathrm{s}}\right) \end{gathered}$ | Domestic demand of tout production (VX, ${ }^{\circ}$ ) | Domestic demand as \% of total production | Exports of goods (ET,) | Exports as \% of total production | Sectoral shares in total exports (\%) |

### 3.5. The Capital Account

The aggregate capital account presents the consolidated balance between total savings and total investment in Pakistan for the year 1989-90. The accounts show that how total investment is financed through the savings of various economic agents namely households, firms, government, and rest of the world. Table 9 shows the estimates of savings of various economic agents and sources of financing of overall investment in Pakistan for the year 1989-90. It shows that total investment is financed by 33 percent of household saving, 23.1 percent of firms savings, and 18.7 percent of foreign savings. In addition to savings of economic agents, consumption of fixed capital (depreciation) accounts for 49.7 percent of total investment. It is also noted from Table 9 that in the year 198990 , the government had negative saving of 24.6 percent of total savings. Regarding the sectoral breakdown of aggregate investment, Table 9 also shows
that the share of total investment in agriculture is less than 1 percent, in industry 59 percent, and the remaining 40.0 percent of total investment is allocated to the other sectors of the economy. It is worth to note that only 0.012 percent share of total investment is allocated to both education and health.

Table 9
Saving-Investment Balance in 1989-90

## 4. DISAGGREGATION OF HOUSEHOLDS BY INCOME GROUPS

In the following sub-sections, we describe the theoretical and numerical perspectives of the disaggregation of urban and rural households by income groups in Pakistan.

### 4.1. Disaggregation of Households by Income Groups: <br> A Theoretical Perspective

Aggregate households account in SAM 1989-90 (developed in the earlier section in Table 1) is disaggregated by four income groups for rural and urban areas of Pakistan separately. Both urban and rural households are distinguished into four income groups namely lowest income group having monthly income upto Rs.2500, low income group Rs.2501-4000, middle income group Rs.40017000 and high income group Rs. 7001 \& above. The structure of disaggregated SAM for 1989-90 is presented in Table 10. The disaggregation of the households turns the aggregate SAM 1989-90 of 21x21 matrix reported in Table 1 into $28 \times 28$ matrix which is presented in Table 10. Thus, rows 3 to 10 in Table 10 present the disaggregation of row 3 in Table 1 (aggregate income account of households).

These rows show the channeling of income from domestic production activities to various categories of factors of production and then to these households groups. Rows 3 to 10 also show other sources of income of the households i.e., income from capital, dividends from firms, transfers from the government and net transfers from the rest of the world. The respective columns 3 to 10 in Table 10 present the disaggregation of column 3 (aggregate expenditure of the households) in Table 1. These columns present the expenditure of above mentioned income groups on different commodities. In other words, columns 3 to 10 present demand of these households for agriculture, industry, education, health, and other commodities. First four columns ( $3-6$ columns) in Table 10 show the demand of these commodities by urban households. While the later four columns (7-10 columns) present the expenditure by four rural income groups. Households' income and expenditure identities for rural and urban income groups can be written by balancing the rows with their respective columns as follows:

## Urban Households

Income: WHU,,+RKHUH + DIVHU,,+TCHtM + TRHU,, $=$ Yhl,
Expenditure: $I D H U_{,},+$DHUni $^{+}$SHUn $=Y H U, \ldots \ldots$... ... (22)

## Rural Households

WHUn and RKHUn are labour income and capital income, respectively, received by nth income groups in urban areas of Pakistan. All these households also receive incomes from other institutions such as dividends from firms (DIVHUn), transfers from the government (TGHUn) and net transfers from die rest of the world ( $\mathrm{T}_{\text {ヘヘ }}$ ). Similalry, WHR, and RKHRn are labour income and capital income, respectively, received by nth income groups in rural areas of Pakistan and incomes from other institutions for rural households are dividends from firms (DIVHRn), transfers from the government (TGHRn) and net transfers from the rest of the world (TRHRn). The disaggregation shows the distribution of income from different sources among various households groups. In accounting principal, income of households must be equal to households expenditure as mentioned in identities (21-24). Therefore, taxes paid to the government (IDHUn) and households consumption of goods and services (DHUnj) represent the total expenditure by the nth households groups in the urban areas on ith commodity and the rest is saved by the households as saving (SHUn). Similarly, IDHRn, (DHRj), and SHRn show the expenditure of nth income groups on indirect taxes paid to the government, expenditure on ith commodities and savings, respectively, by rural income groups in Pakistan.

### 4.2. Disaggregation of Households by Income Groups: A Numerical Presentation

Table 11 present SAM-1989-90 with disaggregation of household sector by income groups for rural and urban areas of Pakistan. Receipts and expenditures of urban and rural income-groups are presented in it. Rows 3 to 10 in Table 11 show distribution of income from different sources among the rural and urban households of Pakistan by the nth income groups. Similarly, columns 3 to 10 provide structure of consumption of goods by sector of origin of these households. Detailed patterns of income and expenditure of these income groups are given in Tables 12 to 19, which are derived from Table 11. These Tables show percentage distribution of income and expenditure across income groups and within income groups for rural and urban areas of Pakistan. The patterns of income and expenditure of various income groups are briefly described as follows.

### 4.2.1. Income Distribution by Sources of Income

Table 12 presents percentage distribution of income from different sources across the income groups in urban areas of Pakistan. It shows that 43.1 percent households are in the lowest income group, who earns upto Rs. 2500 per month. While the second and third income groups who earn between Rs.2501-4000 and Rs.4001-7000 per month, respectively, consist of 29.1 percent and 19.2 percent of total urban households. The highest income group contains only 8.3 percent of total households. Table 12 also shows that the highest income group receives highest percentage of total income i.e., 31 percent (although the minimum percentage of households lie in this group). On the other hand, maximum percentage of households lies in the lowest income group but they receive minimum percentage of total income i.e. only 18 percent of total income).

Pakistan is a labour abundant country and labour power is the main source of income specially for the poor people. Second row of Table 12 shows that 43.1 percent poorest households.receive 24.4 percent of total wages and salaries and 8.3 percent richest households receive 21.9 percent of total wages and salaries. While 48.4 percent of total households (both low and middle income groups) receive about 53.8 percent of total wages and salaries. Table 12 also shows that the high income group receives the highest share almost from all other sources, i.e., capital income ( 28.6 percent), dividends from firms ( 56.2 percent), transfers from the government ( 52.2 percent) arid net transfers from the rest of the world ( 63 percent). On the other hand, the lowest income group (but the highest percentage of households) receives lowest share from the other sources of income, i.e. 17.6 percent as capital income, 3.2 percent as dividends from firms,. 16.2 percent as transfers from the government, and only 2.7 percent as transfers from the rest of the world. Thus, it presents a clear picture of skewed income distribution in urban areas of Pakistan.

Table 12
Percentage Shares of Income by Different Sources Across Urban Households

|  | Households by income groups |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Sources of income | up to Rs. 2500 | Rs. $2501-4000$ | Rs. $4001-7000$ | Rs. $7001 \&$ above | Total |
| Percentage shares of households | 43.08 | 29.12 | 19.23 | 8.25 | 100 |
| Wage and salaries | 24.37 | 27.94 | 25.82 | 21.87 | 100 |
| Capital income | 17.64 | 24.85 | 28.88 | 28.64 | 100 |
| Dividends from firms | 3.23 | 16.15 | 24.44 | 56.19 | 100 |
| Transfers from the government | 16.21 | 10.59 | 21.04 | 52.16 | 100 |
| Transfers from the rest of the world | 2.66 | 10.39 | 23.93 | 63.02 | 100 |
| Total | 18.11 | 24.10 | 26.83 | 30.95 | 100 |

Table 13 presents the percentage shares of total income within an income group from different sources. First column of Table 13 shows that the main source of income of the poorest household is wages and salaries i.e. 54.2 percent of their total income comes from wages and salaries and 42.2 percent of their total income comes from capital. The remaining income of the lowest income group is received as dividends from firms ( 1.1 percent), transfers from the government ( 1.1 percent) and transfers from the rest of the world ( 1.3 percent). The richest group of households earns 28.5 percent from wages and salaries and 40.1 percent from the capital income. It is worth noting that as contrast to the lowest income group, high income group receives largest share from capital income. The incomes of this group from other sources are also higher than the income of the lowest income group. It receives 11.6 percent of their total income from firms as dividends, 2.1 percent as transfers from the government and 17.7 percent as transfers from the rest of the world.

Table 13
Percentage Shares of Income by Different Sources Within Urban Households

|  | Households by Income Groups |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Sources of Income | up to Rs.2500 | Rs. $2501-4000$ | Rs.4001-7000 | Rs.7001\& above |
| Percentage of households | 43.08 | 29.12 | 19.23 | 8.25 |
| Wage and salaries | 54.24 | 46.73 | 38.80 | 28.49 |
| Capital income | 42.21 | 44.69 | 46.65 | 40.11 |
| Dividends from firms | 1.14 | 4.27 | 5.81 | 11.58 |
| Transfers from the government | 1.14 | 0.56 | 1.0 | 2.14 |
| Transfers from the rest of the world | 1.28 | 3.74 | 7.74 | 17.68 |
| Total | 100 | 100 | 100 | 100 |

Table 14 shows the percentage distribution of income across the rural income groups from different sources. It shows that 59.8 percent of aggregate households in rural areas are in the lowest income group and only 4.5 percent households are in the high income group. Table 14 shows that 51.2 percent of total wages and salaries in mral areas is earned by poorest households. On the other hand, the high income group receives 8.3 percent of total wages and salaries.

Table 14 also shows that 25.9 percent income from capital accrues to poorest income group and 22.4 percent to richest households. The largest shares from firms as dividends ( 51.7 percent), transfers from the government ( 70.8 percent) and transfers from the rest of the world ( 42.5 percent) go to the richest households group. The lowest income group receives 9.9 percent of total dividends as dividends from firms, 15.6 percent of total transfers as transfers from the government and 15.1 percent as transfers from the rest of the world. It is worth to note that 70.8 percent of total government transfers is going to the richest households while only 15.6 percent government transfers go to the poorest households.

Table 14
Percentage Shares of Income by Different Sources Across Rural Households

|  | Households by income groups |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Sources of income | up to Rs.2500 | Rs. $2501-4000$ | Rs. $4001-7000$ | Rs. $7001 \&$ above | Total |
| Percentage of households | 59.80 | 22.10 | 13.58 | 4.46 | 100 |
| Wage and salaries | 51.17 | 23.44 | 17.13 | 8.27 | 100 |
| Capital income | 25.90 | 25.11 | 26.59 | 22.40 | 100 |
| Dividends from Firms | 9.89 | 15.74 | 22.67 | 51.70 | 100 |
| Transfers from the government | 15.64 | 8.35 | 5.24 | 70.77 | 100 |
| Transfers from the rest of the world | 15.06 | 21.14 | 21.31 | 42.49 | 100 |
| Total | 29.36 | 23.58 | 23.68 | 23.38 | 100 |

Table 15 shows income received by rural income groups from different sources as percentage of their respective incomes. All income groups in rural areas earn highest income from capital. It contributes 56.6 percent, 68.3 percent, 72 percent, and 61.5 percent in incomes of the lowest, low, middle, and high rural income groups, respectively. Table 15 also shows that lowest income group receives 37.4 percent of their total income from wages and salaries. While the highest group receives 7.6 percent of their total income from wages and salaries. It is worth to note from Table 15 that as mral households monthly income level increases, percentage shares in dividends from firms and percentage shares in transfers from the rest of the world also increase. These groups from the lowest to the highest income groups receive 2.6 percent, 5.2 percent, 7.4 percent and 17.1 percent of their respective income as dividends from firms, respectively. Transfers from the government as percentage of the household income are 4.3 percent to the high income group, 0.3 percent to the middle income group, 0.5 percent to the low income and 0.8 percent to the lowest income group. It is worth noting that shares of wages and salaries in households total income fall as income rises and shares of income from all other sources increase as monthly incomes of rural households rise.

### 4.2.2. Expenditure by Different Income Groups

Tables 16 shows uses of households income by various urban income groups. It shows that expenditure on agriculture is 27.3 percent by the lowest income group and 17.0 percent by the highest income group in urban areas. Expenditures on manufacturing products are 18.2 percent and 26.3 percent of total expenditure by the high and lowest income groups, respectively. Fourth row in Table 16 also shows expenditure on education by different urban income groups. It is worthwhile to note that the expenditure on education rises with the rise of income levels, i.e., 40.6 percent of total expenditure by the high income group and only 12.1 percent of total expenditure by the lowest income group. The order is reverse for expenditure on health as the lowest income group spends 26.2 percent and high income group 15.4 percent of total expenditure on health. Expenditure on commodities other than mentioned above is high by the highest income group and low by the lowest income group. In Pakistan tax system is progressive, so the highest share in total taxes ( 37.2 percent) is paid by the high income group (as the highest income group receives highest share from total income 31 percent of total income). While the lowest income group pays 7.3 percent of total taxes in urban areas. Similarly, households with high income contribute lions' share to total households saving while lowest and low income groups have negative savings as reported in Table 16.

Table 16
Uses of Incomes by Urban Households

| Uses of Incomes | Income Groups |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | up to Rs. 2500 | Rs.2501-4000 | Rs.4001-7000 | Rs. $7001 \&$ above | Total |
| Percentage of households | 43.08 | 29.12 | 19.23 | 8.25 | 100 |
| Agriculture | 27.28 | 29.34 | 26.39 | 16.98 | 100 |
| Manufacturing | 26.34 | 28.66 | 26.77 | 18.23 | 100 |
| Education | 12.05 | 22.08 | 25.32 | 40.55 | 100 |
| Health | 26.15 | 28.50 | 29.96 | 15.38 | 100 |
| Others | 20.70 | 25.18 | 25.76 | 28.36 | 100 |
| Taxes paid | 7.25 | 18.84 | 36.71 | 37.20 | 100 |
| Saving | -121.78 | -52.75 | 34.94 | 239.59 | 100 |
| Total | 18.11 | 24.10 | 26.83 | 30.95 | 100 |

Table 17 presents the percentage expenditure by various urban income groups. It reveals that the largest share of incomes of all income groups is spent on manufactured products such as 56 percent by the lowest income group, 45.8 percent by the low income group, 38.4 percent by the middle income group and 22.7 percent by the high income group.

Table 17
Uses of Income Within Urban Households

|  | Income Groups |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Uses of Income | up to Rs.2500 | Rs.2501-4000 | Rs.4001-7000 | Rs. 7001 \& above |
| Percentage of households | 43.08 | 29.12 | 19.23 | 8.25 |
| Agriculture | 43.19 | 34.90 | 28.20 | 15.73 |
| Manufacturing | 55.97 | 45.77 | 38.41 | 22.67 |
| Education | 0.68 | 0.93 | 0.96 | 1.33 |
| Health | 0.93 | 0.76 | 0.72 | 0.32 |
| Others | 29.79 | 27.23 | 25.63 | 23.88 |
| Taxes paid | 0.21 | 0.41 | 0.72 | 0.63 |
| Saving | -30.77 | -10.02 | 5.96 | 35.43 |
| Total | 100.0 | 100.0 | 100.0 | 100.0 |

The second highest expenditure is on agriculture products by all income groups. Lowest, low, middle and high income groups, respectively, spend 43.2 percent, 34.9 percent, 28.2 percent and 15.7 percent of their total income on agriculture. Comparison of the percentage expenditure on education by these income groups shows that it increases with the rise of income levels but conversely percentage expenditure on health declines with the rise of income levels. The poorest group of households spends 0,7 percent of their total income on education and 0.9 percent of their income on health. While the richest income group spends 1.3 percent of their income on education and 0.3 percent of their income on health. Low and middle income groups spend 0.9 percent and 1.0 percent of their income on education and 0.8 percent and 0.7 percent on their health, respectively. Table 17 also shows that the lowest and low income groups are net dissaver as negative 30.8 percent and negative 10 percent of their expenditure are financed by consuming existing assets or through borrowing. While the highest income group saves 35.4 percent of their total income.

Table 18 presents expenditure pattern of rural households where 60 percent of total population live. It shows almost the similar pattern in expenditure as is found in the case of urban income groups. It clearly shows that the highest shares of total expenditure on agriculture and manufactured commodities are spent by the poorest income group. It is worth noting that as income level increases, the expenditures on these two commodities decline. The same patterns are found in expenditures on education, health and others commodities. As is the case of urban
income groups, the largest share in taxes paid to the government is by the high income group. The same is the case with households savings. The first two income groups are dissaver as their savings are negative 76.9 percent and 6.2 percent of total saving. But the later two income groups are net saver and largest contribution to the household saving is by the high income group.

Table 18
Uses of Income by Rural Households

| Uses of Income | Income Groups |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| up to Rs.2S00 | Rs.2S01-4000 | Rs.4001-7000 | Rs.7001 \& above | Total |  |
| Percentage of households | 59.80 | 22.10 | 13.58 | 4.46 | 100 |
| Agriculture | 43.89 | 26.19 | 20.19 | 9.72 | 100 |
| Manufacturing | 43.62 | 25.79 | 20.52 | 10.07 | 100 |
| Education | 30.82 | 27.92 | 25.71 | 15.56 | 100 |
| Health | 41.44 | 24.52 | 22.66 | 11.39 | 100 |
| Others | 38.14 | 25.18 | 22.56 | 14.12 | 100 |
| Taxes paid | 15.31 | 7.654 | 12.24 | 64.80 | 100 |
| Saving | -76.94 | $\mathbf{- 6 . 2 2}$ | 47.02 | 123.70 | 100 |
| Total | 29.36 | 23.58 | 23.68 | 23.38 | 100 |

Table 19 shows the pattern of expenditure within the rural income groups. It reveals that the lowest income group spends 45.9 percent of total expenditure on agriculture and 57.3 percent on manufactured commodities. Table 19 also shows that as income rises percentage expenditure of total expenditure on these commodities declines. The expenditures on agriculture commodities are 34.1 percent, 26.2 percent, and 12.8 percent of total expenditure by low, middle and high income groups of their total expenditure, respectively. Similarly, expenditures on manufactured commodities are 42.2 percent, 33.4 percent, and 16.6 percent of total expenditure by the low, middle, and high income groups. Expenditure on education by all these income groups is less than 0.5 percent of their income. The same is case for the health expenditure by all income groups. It is also worth noting that the expenditure on health as percentage of their total income declines as income level rises. The high income group pays 1.3 percent of its income as taxes to the government. While the lowest, low and middle income groups pay less than 0.5 percent of their incomes as taxes to the government. Lowest rural income group is a dissaver as last row of Table 19 shows 28.6 percent dissaving of this group, which means that it spends more than its income. The other three rural income groups save, respectively, 2.9 percent, 21.7 percent and 57.7 percent of their incomes. It is also worth noting that high income group in rural areas saves 57.7 percent of its income as compared to the urban high income group, who saves 35.4 percent of its income.

Table 19
Uses of Income Within Rural Households

|  | Income Groups |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Uses of Income | up to Rs.2500 | Rs. $2501-4000$ | Rs.4001-7000 | Rs.7001 \& above |
| Percentage of households | 59.80 | 22.10 | 13.58 | 4.46 |
| Agriculture | 45.94 | 34.14 | 26.21 | 12.78 |
| Manufacturing | 57.29 | 42.18 | 33.43 | 16.62 |
| Education | 0.39 | 0.44 | 0.40 | 0.25 |
| Health | 0.96 | 0.71 | 0.65 | 0.33 |
| Others | 23.73 | 19.51 | 17.41 | 11.03 |
| Taxes paid | 0.24 | 0.15 | 0.24 | 1.30 |
| Saving | -28.57 | 2.87 | 21.65 | 57.68 |
| Total | 100.0 | 100.0 | 100.0 | 100.0 |

## 5. MULTIPLIER ANALYSIS

The mosfcommon feature of compiling a social accounting matrix is that it can be used to calculate impact multipliers of socio-economic linkages in an economy. Pyatt and Round (1985) provided a comprehensive measure of multiplier effects, which is used here. This measure provides average propensities of endogenous and exogenous accounts, Leontief input-output multipliers, aggregate multipliers and leakage multipliers in a general equilibrium framework. The aggregate multiplier can be further decomposed in order to derive the direct and indirect effects and the main causal linkages underlying the structure of the economy. The procedure to calculate the multiplier effects is as follows. First, the SAM for Pakistan for the year 1989-90 reported in Table 11 is divided into exogenous and endogenous accounts. Here, we consider government, rest of the world, and capital accumulation as exogenous accounts while all other accounts in the SAM are treated as endogenous accounts. The total income of endogenous accounts $(\mathrm{Yn})$ is given by the sub total of income of endogenous accounts $(\mathrm{N})$ matrix of SAM transactions between endogenous accounts - plus sub total of income of exogenous accounts ( X ) - matrix of injections from exogenous into endogenous accounts. So we can write down the equation for total income of endogenous accounts as follows:

$$
\begin{equation*}
Y_{n}=N+X \quad \ldots \quad \ldots \quad \ldots \quad \ldots \tag{25}
\end{equation*}
$$

In die SAM framework, there is linear proportional relationships between particular expenditures and their corresponding totals, which are called average propensity to spend (AJ, which can be calculated as dividing each cell of endogenous accounts by its respective column sum. The matrix of the sub total of income of endogenous accounts ( N ) can be calculated as follows:

$$
\begin{equation*}
N=A_{\#} . Y_{\#} \tag{26}
\end{equation*}
$$

Substituting equation (26) into equation (25) and rearranging it we get:

$$
\begin{equation*}
Y_{n}=\left(I-A J r^{\prime} \cdot X=M a \cdot X\right. \tag{27}
\end{equation*}
$$

Where M , is aggregate multiplier. Similarly, total income of exogenous accounts (YJ consists of matrix of leakages frpm endogenous accoimts into exogenous accoimts (L) and matrix of SAM transactions between exogenous accounts ( R ), which can be written as:

$$
\begin{equation*}
Y X=L+R \quad \ldots \quad \ldots \quad \ldots \quad \ldots \tag{28}
\end{equation*}
$$

The average propensities to leake ( $A$, ) can be calculated as dividing each cell of exogenous accounts by its respective column sum. The matrix of average propensities to leak from endogenous accounts can be calculated from the following equation:

$$
\begin{equation*}
L=A, . Y_{„} \tag{29}
\end{equation*}
$$

Substitutiiig equation $\left\langle 27\right.$ ) for $Y_{\text {„, into equation (29) we get: }}$

$$
L=A, . M a . X
$$

Where (A).MJ is aggregate leakage multiplier matrix for exogenous accounts. Incorporating equation (30) for L into equation (28) we get total income of exogenous accounts (Yx) with its aggregate leakage multiplier matrix as follows:

$$
Y x=A, \cdot M a \cdot X+R
$$

In order to decompose aggregate multiplier (MJ into intra-group effects, extra-group effects and cross effects, we need to define a block diagonal matrix $\mathrm{A}_{\boldsymbol{\wedge}}$, which is a matrix of coefficients of endogenous accounts including elements at the intersection of different groups of accounts in order to identify different multiplier effects. Therefore, the matrix of average propensities to spend (AJ pan be further partioned into matrix of diagonal elements $\left(\mathrm{A}_{\Lambda}\right)$ and matrix of offdiagonal elements ( $\mathrm{A} \Lambda$, which is written as follows:

$$
A n=A_{x a}+A n s \quad \ldots \quad \ldots \quad \ldots \quad . . . . \quad-\quad(32)
$$

After defining $\mathrm{A}_{, 0}$ and $\mathrm{A}_{, 55}$, the aggregate multiplier matrix (MJ can be decomposed into three components such as intra-group effects (Mal), extra-group effects ( $\mathrm{M}_{\wedge}$ ), cross effects ( Mtf ), which are written as follows:

$$
\begin{array}{llllll}
M a l=\left(I-A J^{-1}\right. & \ldots & \ldots & \ldots & \ldots & \ldots \\
M a:=(I+A l K+A j) & \ldots & \ldots & \ldots & \ldots & \ldots \tag{34}
\end{array}
$$

$$
\begin{equation*}
M a_{3}=(I-\boldsymbol{A} \boldsymbol{j})^{-3} \tag{35}
\end{equation*}
$$

Where Mal captures the effects of one group on itself through direct transfers and $\mathbf{M}_{\mathbf{a}^{2}}$ captures the cross-effects of the multiplier process whereby an injection into one account of the system has repercussions on the other accounts. Matrix $\mathbf{M}_{\mathbf{a 3}}$ shows the full circular effects of an injection going round the system and back to its point of origin in a series of repeated and dampening cycles. Thus, equation (27) can be rewritten as follows:

$$
\begin{equation*}
Y_{n}=\left(M a I \cdot M a_{2} \cdot M a_{3}\right) \cdot X \tag{36}
\end{equation*}
$$

Pyatt and Round respecify equation (32) as:

$$
\begin{equation*}
Y_{„}=(1+T+O+C) \cdot X \tag{37}
\end{equation*}
$$

Where I is referred as initial impulse or identity multiplier, T as transfer multiplier, O as open-loop multiplier, and C as closed -loop multiplier, which can be written in algebraic forms as follows:

$$
\begin{array}{lllllll}
\boldsymbol{T}=(M a,-I) & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
\boldsymbol{O}=\left(M a_{1}-1\right) \cdot M a, & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots  \tag{39}\\
\boldsymbol{C}=\left(M a_{3}-1\right) \cdot M a_{2} \cdot M a, & \ldots & \ldots & \ldots & \ldots & \ldots
\end{array}
$$

The estimates of all the above mentioned equations (25) to (40) are presented in Appendix Tables 1 to 14 which are briefly discussed. Appendix Table 1 shows the average propensities to expenditure for endogenous accounts (AJ while average propensities to leak for exogenous accounts ( A, ) are reported in Appendix Table 2. Appendix Table 3 presents block diagonal elements ( $\mathrm{A} n_{0}$ ), which are the matrix of coefficients of endogenous accounts including elements at the intersection of different groups of accounts and they identify as intra-group multiplier effects. Appendix Table 4 presents aggregate multipliers (MJ. Leakage multiplier matrix (Aj.MJ is presented in Appendix Table 5, which shows that, in aggregate, injections into the system are equal to the leakages ${ }^{6}$. Appendix Tables 6 to 8 present the decomposition of aggregate multipliers into intra-group or direct effects (Ma), extra-group or own indirect effects ( $\mathrm{M}_{\wedge}$ ), and cross effects ( $\mathrm{M}_{\wedge}$ ), respectively. Further decomposition of aggregate multiplier effects into transfer multiplier effects ( T ), open-loop multiplier effects ( O ), and closed-loop multiplier effects (C) are reported in Appendix Tables 9 to 11, which are also summarised in

[^5]Appendix Table 12. Furthermore, multiplier effects by types of endogenous accounts are reported in Appendix Tables 13 and 14.

On the basis of above mentioned Appendix Tables, the results of the multipliers are summarised in Table 20, which are of our great interest. The values in columns 1 to 5 give the 'backward linkages' of the endogenous accounts, which indicate the measure of the opportunities offered to suppliers arising from marginal changes in the final demand (i.e. one unit increase in exogenous accounts). While the vector of the sum of rows in Table 20 gives the 'forward linkages' which give the total effect on endogenous accounts of a unit change in all exogenous accounts. Thus, these accounting multipliers show the effect of injections into the system through exogenous accounts on endogenous accounts. Table 20 also shows that the multipliers for all endogenous accounts imply a high degree of integration of the accounts in Pakistan's economy. For the production sectors, backward linkages are strongest for the education, followed by agriculture, health, other sectors and industry. The largest forward linkage multipliers are found for industry, followed by other sectors, agriculture, health, and education. Regarding the households income groups, the largest backward linkage is found for the urban poorest (HU1 having income less than Rs. 2500 per month) and smallest for the rural rich (HR4 having income more than Rs. 7000 per month). While the largest forward linkage is for the rural poorest (HR1 having income less than Rs. 2500 per month) and smallest for the urban poorest (HU1 having income less than Rs. 2500 per month). ${ }^{7}$

The linkages between the accounts of the SAM can also be analysed by decomposing the aggregate multiplier effects into the intra-group effects (the effect of an exogenous injection into the group of accounts where it was originally entered); open-loop effects (the first round of extra-group or cross effects of an injection outside the group of accounts where the injection was originally entered); closed-loop effect (the circular or inter group effects starting with repercussions of the extra group effects on the original accounts and die subsequent round effects). The breakdown of aggregate multipliers is also reported in Table 20. Columns 2 and 7 in Table 20 show the initial impulse (i.e. unit increase), which is the amount injected into endogenous accounts through exogenous accounts. Table 20 shows the various degree of impacts of this injected unit on all the endogenous accounts. Starting from backward linkages, for example, transfer multiplier in column 3 is 0.369 only for the firms while for all other accounts the values are zeros. Columns 4 and 5 in Table 20 reports open-loop multipliers and closed-loop multipliers, which show the impact of an injection before reaching the original account and after reaching the original account, respectively. Regarding the households income groups, open-loop and closed-loop multipliers are highest for the poorest income groups in urban and rural areas and smallest for the richest income groups in both

[^6]
## Table 20

Decomposition of Total Multiplier Effects

the areas, implying that any injection into exogenous accounts may have more impact on poorest than richest people. Regarding commodity producing sectors, the largest open-loop multiplier is for the agriculture and lowest for the industry. On the other hand, closed-loop multiplier is highest for the education followed by agriculture, health, other sectors, and industry. Similarly, regarding the forward linkages, transfers, open-loop, and closed-loop multiplier effects are reported in columns 8 to 10 in Table 20. It shows that the transfer multiplier is highest for the richest rural income group (HR4) and lowest for the poorest urban income group (HU1). Open-loop multipliers in column (9) show that among the income groups, the poorest rural households possess the maximum multiplier while the richest rural households hold die minimum multiplier impact. Regarding the commodity producing sectors, industry has the highest multiplier effect while education has the minimum multiplier effect. Finally, closed-loop multiplier effects reported in column 10 of Table 20 show that rural poorest income group holds the maximum multiplier and the poorest urban group possesses the minimum multiplier effect. Similarly, industry has die highest multiplier effect while education has the lowest multiplier impact.

## 6. CONCLUDING REMARKS

Given that the objective is to understand Pakistan's economy, the starting point is to design a social accounting matrix that, through appropriate choice of classifications, can capture its important characteristics. Therefore, the main objective of this study has been to compile a latest social accounting matrix for the year 1989-90, using the Integrated Institutional Accounts, Input-Output Table and Households Integrated Economic Survey for the same year. "The matrix framework provides useful information about the structure of Pakistan's economy. Within this framework, the preferred classifications of various accounts are undertaken according to the policy objectives and later model building. In its present form, the matrix is not different in information contents from the national accounting system. A data base in a SAM format is relevant and useful for economic analysis of policy issues which concern various economic agents of the economy. The SAM presents four types of accounts: factors account, institutions account, production account, and capital account. These accounts are disaggregated on the basis of requirements and availability of data. Factors of production account is disaggregated into labour and capital accounts. Institutions accounts consist of households, firms (non-financial and financial), government, and rest of the world. Households account is further disaggregated by four income categories of rural and urban households. These accounts elaborate the inter-institutional linkages. Production account is disaggregated into agriculture, industry, education, health and other sectors.

Further disaggregation of production account is also made on the basis of goods for domestic market and for export market. Finally, it presents consolidated capital account. It is worth to note that earlier social accounting matrix for the year 1984-85 developed by the Federal Bureau of Statistics did not provide a disaggregation of the households sector. This limits the analysis of the households sector, particularly when distributive and redistributive aspects need to be given importance. Therefore, this paper fills this gap. In addition, the matrix is also used as a tool for multiplier analysis to provide backward and forward linkages in production, consumption, distribution and accumulation accounts. The multipliers for all endogenous accounts imply a high degree of integration of the accounts. For the production sectors, backward linkages are strongest for the education, followed by agriculture, health, other sectors and industry. The largest forward linkage multipliers are found for industry, followed by other sectors, agriculture, health, and education. Regarding the households income groups, the largest backward linkage is for the urban poorest and smallest for the rural rich. While the largest forward linkage is for the rural poorest and smallest for the urban poorest.

- Definition of Notations Used in Appendix Tables l to 14

| Notations | Definitions |
| :--- | :--- |
| FPLA1 | Labour account |
| FPKA2 | Capital account |
| CIHU1 | Account of urban households (HU1 having income upto Rs.2500 per month) |
| CIHU2 | Account of urban households (HU2 having income between Rs.2501-4000 per month) |
| CIHU3 | Account of urban households (HU3 having income between Rs.4001-7000 per month) |
| CIHU4 | Account of urban households (HU3 having income between Rs.7000 \& above per month) |
| CIHR5 | Account of rural households (HU1 having income upto Rs.2500 per month) |
| CIHR6 | Account rural households (HU2 having income between Rs.2501-4000 per month) |
| CIHR7 | Account of rural households (HU3 having income between Rs.4001-7000 per month) |
| CIHR8 | Account of rural households (HU3 having income between Rs.7000 \& above per month) |
| CIFI9 | Firms account |
| CIG10 | Government account |
| CIR11 | Rest of the world account |
| PAAG1 | Production of agriculture |
| PAIN2 | Production of industry |
| PAED3 | Production of education |
| PAHE4 | Production of health |
| PAOT5 | Production of other sectors |
| DDAG1 | Domestic demand of agriculture goods |
| DDIN2 | Domestic demand of industry goods |
| DDED3 | Domestic demand of education |
| DDHE4 | Domestic demand of health |
| DDOT5 | Domestic demand of other sectors |
| XXAG1 | Agriculture goods for export market |
| XXIN2 | Industrial goods for export market |
| XXHE3 | Health related goods for export market |
| XXOT4 | Goods of other sectors for export market |
| KIAC1 | Accumulation account |

#### Abstract

This report compiles a latest social accounting matrix (SAM) of Pakistan for the year 1989-90. The SAM framework provides useful information about the structure of Pakistan's economy. Within this framework, the preferred classifications of various accounts are undertaken according to the policy objectives and later model building. The SAM presents four types of accounts: factors account, institutions account, production account, and capital account. These accounts are disaggregated on the basis of requirements and availability of data. Factors of production account is disaggregated into labour and capital accounts. Institutions accounts consist of households, firms, government, and rest of the world. Households account is further disaggregated by four income categories for rural and urban areas. Production account is disaggregated into agriculture, industry, education, health and other sectors. Further disaggregation of production account is also made on the basis of goods for domestic market and for export market. Finally, it presents consolidated capital account.

This study also aims to undertake a multiplier analysis, which provides backward-and forward linkages in production, consumption, distribution and accumulation accounts of the economy. The multipliers for all endogenous accounts imply a high degree of integration of the accounts. For the production sectors, backward linkages are strongest for the education, followed by agriculture, health, other sectors and industry. The largest forward linkage multipliers are found for industry, followed by other sectors, agriculture, health, and education. Regarding the households income groups, the largest backward linkage is found for the urban poorest and smallest for the rural rich. While the largest forward linkage is for the rural poorest and smallest for the urban poorest.

[^1]:    'For example, Pyatt and Round (1977, 1979, 1985), Pyatt (1985, 1988, 1991a, 1991b), King (1985), Thorbecke (1985), James and Khan (1993), and Iqbal (1996) all provide excellent introduction to SAMs and their uses.

[^2]:    institutional Sector Accounts for 1984-85 and Integrated Economic Accounts for 1989-90 have almost similar characteristics.
    ${ }^{3}$ For IEA, see Rizvi (1996) Integrated Economic Accounts for 1989-90, Federal Bureau of Statistics, Statistics Division, Government of Pakistan and for 1-O table see Federal Bureau of Statistics (1996), Supply and Use Tables of Pakistan 1989-90, Statistics Division, Government of Pakistan.
    'Since the compilation of a SAM is quite flexible, it has been condensed according to our own choice and specific policy objectives, which will be analysed in detail in the later analysis.

[^3]:    ${ }^{5}$ There is no export of education in the 1-O Table 1989-90.

[^4]:    * Figures in parentheses are with minus sign.

[^5]:    ${ }^{6}$ For detail on further derivation see Pyatt and Round (1985)

[^6]:    ${ }^{1}$ The multipliers need to be interpreted with caution because of several restrictive assumptions underlying the multiplier methodology.
